Reaccredited by NAAC with 'A+' Grade

Department of Chemistry

Syllabus for Master of Science Part - I

**To be implemented
from academic year 2023-24**

(As Per NEP-2020 Guidelines)

Syllabus for M.Sc. I

1. Title: Chemistry (Inorganic, Physical, Organic and Analytical)

2. Year of Implementation:

The syllabus will be implemented from June, 2023 onwards.

3. Preamble:

This syllabus is framed to give advanced knowledge of Chemistry to postgraduate students at first year of two years of M.Sc. degree course. The goal of the syllabus is to make the study of chemistry, interesting and encouraging to the students for higher studies including research. The new syllabus is based on a basic and applied approach with vigor and depth. At the same time precaution is taken to make the syllabus comparable to the syllabi of other universities and the needs of industries and research. The syllabus is prepared after discussion at length with number of faculty members of the subject and experts from industries and research fields. The units of the syllabus are well defined, taking into consideration the level and capacity of students.

4. GENERAL OBJECTIVES OF THE COURSE:

1. To educate and prepare post graduate students from rural and urban area who will get employment on large scale in academic institutes, R & D and Quality control laboratories of Indian chemical/pharmaceutical industries as well as multinational and forensic Laboratories.
2. To provide students with broad theoretical and applied background in all specialization of Chemistry with emphasis on qualitative and quantitative technique.
3. To provide broad common framework of syllabus to expose our young graduates to the recent and applied knowledge of interdisciplinary branches of chemistry involving applied organic, inorganic, physical, analytical, industrial, pharmaceutical, polymer, nano science & technology.
4. To conduct lesser written tests and to encourage on non-written tests.
5. To focus on encouraging students to conduct various academic activities like midterm tests, online tests, open book tests, tutorial, surprise test, oral, seminar, assignments and seminar presentation.

Learning outcomes:

1. A graduate with a Master's degree in Chemistry has in-depth and detailed functional knowledge of the fundamental theoretical concepts and experimental methods of chemistry.
2. The graduate has expert knowledge of a well-defined area of research with in chemistry. The graduate has specific skills in planning and conducting advanced chemical experiments and applying structural-chemical characterization techniques. Skilled in examining specific phenomena theoretically and/or experimentally, the graduate is able to contribute to the generation of new scientific insights or to the innovation of new applications of chemical research.

5. Duration: Two Year

6. Pattern: Semester Examination

7. Medium of Instruction: English

Structure of the Course Credit Distribution

Level	Sem	Major			RM	OJT	RP	Total
		DSC Mandatory		DSE Elective				
		T	P	T				
6	I	12 (3 Papers)	2	4 (1 Paper out of 2)	4	-	-	22
	II	12 (3 Papers)	2	4 (1 Paper out of 2)	-	-	4	22
6.5	III	12 (3 Papers)	2	4 (1 Paper out of 2)	-	-	6	22
	IV	12 (3 Papers)	-	4 (1 Paper out of 2)	-	4	-	22
Total		48	6	16	4	4	10	88
		70			8		10	88

M.Sc. Part I

Semester I

Nature of Course	Course Code	Course Title
Theory	MCT 411	Inorganic Chemistry I
	MCT 412	Organic Chemistry I
	MCT 413	Physical Chemistry I
	MCT 414 E-I	Analytical Chemistry I
	MCT 414 E-II	Applied Chemistry I
	MCT 415	Research Methodology
Practical	MCP 416	Chemistry Practical I: Lab I based on (MCT 411, 412, 413)

Semester II

Nature of Course	Course Code	Course Title
Theory	MCT 421	Inorganic Chemistry II
	MCT 422	Organic Chemistry II
	MCT 423	Physical Chemistry II
	MCT 424 E-I	Analytical Chemistry II
	MCT 424 E-II	Applied Chemistry II
	MCP 425	Research Project
Practical	MCP 426	Chemistry Practical II: : Lab II based on (MCT 421, 422, 423)

M. Sc. Part – I, Semester I
Discipline Specific Course (DSC) (Mandatory)
MCT-411: Inorganic Chemistry I

Course objectives: Students should be able to...

- 1) Understand chemistry of transition elements.
- 2) Study different organometallic compounds and their chemistry.
- 3) Learn the Nuclear chemistry and its importance.
- 4) Acquire the knowledge of nanoscience and nanomaterials

Credits 4	MCT-411: Inorganic Chemistry I	No. of hours perunit / Credit
UNIT I	Chemistry of Transition Elements	15
	1.1. Coordination chemistry of transition metal ions 1.2. Stability constants of complexes and their determination 1.3. Stereochemistry of coordination compounds 1.4. Crystal field theory, splitting of orbital's in low field environment 1.5. Crystal field stabilization energy (CFSE), Factors affecting the crystal field parameters, Examples. 1.6. Spectrochemical series 1.7. Jahn-Teller effect 1.8. Interpretation of electronic spectra including d-d and charge transfer spectra. 1.9. Magnetism and color of transition metal ions.	
UNIT II	Organometallic Chemistry	15 L
	2.1. Synthesis and bonding in pi-metal organometallic complex 2.2. Structure and reactivity of organometallic compounds 2.3. Classification of organometallic compounds based on hapticity and polarity of M-C bond 2.4. Nomenclature and general characters 2.5. 18 electron rule-applications and exceptions 2.6. Reactions of organometallic compounds: Oxidative addition, reductive elimination, Insertion and elimination 2.7. Organometallics in homogeneous catalysis: Hydrogenation, hydroformylation, isomerization and polymerization	
UNIT III	A. Nuclear Chemistry	08 L
	3.A.1. Radioactive decay and equilibrium 3.A.2. Nuclear reactions, Q value, cross sections 3.A.3. Types of reactions 3.A.4. Chemical effects of nuclear transformations 3.A.5. Fission and fusion 3.A.6. Fission products and fission yields 3.A.7. Radioactive techniques	

	B. Transition Metal Carbonyls and Related Compounds	07 L
	3.B.1. Introduction, Preparation, structure, physical and chemical properties of metal carbonyls, 3.B.2. Anionic and cationic carbonyl complexes, 3.B.3. Lewis base derivatives of carbonyls, 3.B.4. Carbonyl hydrides and Carbonyl halides.	
UNIT IV	Nanoscience and Nanomaterials	15 L
	4.1. Introduction to nanoscience and nanotechnology 4.2. Historical background 4.3. Classification of nanomaterials: 1D, 2D, 3D (with their examples) 4.4. Applications of nanotechnology & Nanomaterials 4.5. Implications of nanotechnology 4.6. Future fantasy and nanotechnology 4.7. Experimental methods for preparation of nanomaterials: Chemical and Physical techniques 4.8. Size dependent properties of nanoparticles 4.9. Characterization techniques for nanomaterials: Principle, instrumentation and applications of XRD, SEM and TEM	

Course outcomes: After completion of the course students will be able to...

- 1) Apply the theories for coordination compounds and their applications.
- 2) Demonstrate the bonding in organometallic compounds.
- 3) Explain the Nuclear transformations and its uses.
- 4) Demonstrate the nanoscience, nanotechnology and nanomaterials.

MCT-412: Organic Chemistry I

Course objectives: Students should be able to...

- 1) Know different reactive intermediate also concept of aromaticity
- 2) Understand the mechanism of different types of substitution reactions.
- 3) Acquire the knowledge of addition and elimination reactions.
- 4) Learn the important basic concepts of the stereochemistry.

Credits 4	MCT-412: Organic Chemistry I	No. of hours perunit / Credit
UNIT I	Reaction Mechanism: Structure and Reactivity	15 L
	1.1 Types of reactions, 1.2 Chemical bonding and basis of reactivity- Chemical bond, 1.3 Delocalization, conjugation, resonance, hyper conjugation, tautomerism, inductive effects. 1.4 Acidity and basicity: various structural effects, hard and soft acid and base concept; 1.5 Aromaticity: Structural, thermochemical, and magnetic criteria for aromaticity, including NMR characteristics of aromatic systems. 1.6 Benzenoid and non-benzenoid compounds, Huckels rule, antiaromaticity, Application to carbocyclic and heterocyclic systems, nulenes, azulenes, tropylium cations, metallocenes, current concepts of aromaticity.; 1.7 Structure and stability of reactive intermediates, carbenes, nitrenes, carbocations, carbanions and free radicals.	
UNIT II	a) Aliphatic Nucleophilic substitutions	07 L
	2.a.1. The SN^2 , SN^1 and SN^i reactions with respects to mechanism and stereochemistry. 2.a.2. Nucleophilic substitutions at an allylic, aliphatic trigonal, benzylic, aryl and vinylic carbons. 2.a.3. Reactivity effect of substrate structure, effect of attacking nucleophiles, leaving groups and reaction medium. 2.a.4. SN reactions at bridge head carbon, competition between SN^1 and SN^2 , 2.a.5. Ambident nucleophiles, Neighboring Group Participation.	
	b) Aromatic Electrophilic Substitutions	08 L
	2.b.1. Introduction, the arenium ion mechanism, orientation. 2.b.2. Reactivity in Nitration, Sulphonation, Friedel-Crafts and Halogenation in aromatic systems, energy profile diagrams. 2.b.3. The ortho/para ratio, ipso attack, concept of aromaticity, orientation in their ring systems. 2.b.4. Diazo-coupling, 2.b.5. Vilsmeier-reaction, 2.b.6. Von-Richter rearrangement.	

UNIT III	a) Addition Reactions	08 L
	<p>3.a.1. Addition to C-C multiple bonds mechanism and stereo chemical aspects of addition reaction.</p> <p>3.a.2. Electrophile, nucleophile and free radicals,</p> <p>3.a.3. Regio and chemo selectivity,</p> <p>3.a.4. Orientation and reactivity,</p> <p>3.a.5. Conjugate addition.</p>	
	b) Elimination Reactions:	07 L
	<p>3.b.1. The E¹, E² and E¹CB mechanisms.</p> <p>3.b.2. Orientation in Elimination reactions.</p> <p>3.b.3. Hoffman Versus Saytzeff elimination,</p> <p>3.b.4. competition between substitution and elimination reactions,</p> <p>3.b.5. Reactivity:</p> <p>3.b.5.1. effects of substrate structures,</p> <p>3.b.5.2. attacking base,</p> <p>3.b.5.3. the leaving group,</p> <p>3.b.5.4. the nature of medium on elimination reactions.</p> <p>3.b.6. Pyrolytic elimination reactions.</p> <p>3.b.6.1. Chugaev reaction,</p> <p>3.b.6.2. Pyrolysis of acetates.</p>	
UNIT IV	Stereochemistry	15 L
	<p>4.1. Introduction:</p> <p>4.2. Molecules with two or more chiral centers:</p> <p>4.3. Configurational nomenclature</p> <p>4.4. Constitutionally unsymmetrical molecules: Erythro-Threo and Syn-Anti systems. Constitutionally symmetrical molecules with odd and even number of chiral centers:</p> <p>4.5. Enantiomeric and meso forms,</p> <p>4.6. concept of stereogenic, chirotopic and pseudo asymmetric centers.</p> <p>4.7. Axial and planar chirality: Principles of axial and planar chirality.</p> <p>4.8. Prochirality: Homotopic, heterotopic and diastereotopic ligands and faces.</p> <p>4.9. Identification using substitution and symmetry criteria.</p> <p>4.10. Nomenclature of stereoheterotopic ligands and faces.</p> <p>4.11. Symbols for stereoheterotopic ligands in molecules with one or more prochiral centres,</p>	

Course outcomes: After completion of the course students will be able to...

- 1) Explore conceptual fact of Chemical bonding and basis of reactivity.
- 2) Compare the SN₂, SN₁ and SN_i reactions with respects to mechanism, orientation and stereochemistry of aromatic systems.
- 3) Explain addition reactions and elimination reactions.
- 4) Know the configurations of molecules with two or more chiral centers and Homotopic, heterotopic, diastereotopic ligands and faces.

MCT-413: Physical Chemistry I

Course objectives: Students should be able to...

- 1) Understand the application Gibbs-Duhem equation to study partial quantities.
- 2) Study the photochemistry and fluorescence.
- 3) Study the chemistry of macromolecules.
- 4) Acquire the basic concepts of Molecular Spectroscopy.

Credits 4	MCT-413: Physical Chemistry I	No. of hours perunit / Credit
UNIT I	Thermodynamics	15 L
	1.1. Introduction : revision of basic concepts: Entropy and third law of thermodynamics 1.2. Methods of determining the practical absolute entropies 1.3. Entropies of phase transition 1.4. Maxwell relations and its applications, thermodynamic equation of state 1.5. Ideal and non-ideal solutions 1.6. Thermodynamics of non-electrolyte solutions 1.7. Raoult's law 1.8. Duhem-Margules equation and its applications to vapor pressure curves (Binary liquid mixture). 1.9. Gibbs-Duhem equation and its applications to study of partial molar quantities 1.10. Chemical potential, variation of chemical potential with temperature & pressure 1.11. Henry's law 1.12. Excess and mixing thermodynamic properties 1.13. Equilibrium constants and general conditions of equilibrium in terms of thermodynamic potentials 1.14. Numerical Problems.	
UNIT II	A] Photochemistry	08 L
	2a.1 Absorption of light and nature of electronic spectra 2a.2 Electronic transition 2a.3 Frank Condon principle 2a.4 Selection rules 2a.5 Photo-dissociation 2a.6 Pre-dissociation 2a.7 Photo-physical phenomena: Electronic structure of molecules 2a.8 Molecular orbital 2a.9 Electronically excited singlet states 2a.10 Designation based on multiplicity rule 2a.11 Life time of electronically excited state 2a.12 Construction of Jablonski diagram 2a.13 Electronic transitions and intensity of absorption bands 2a.14 Photo-physical pathways of excited molecular system	

	(radiative and nonradiative) 2a.15 Photochemistry of environment: Green house Effect.	
	B]Fluorescence Spectroscopy	07 L
	2b.1 Introduction 2b.2 Delayed fluorescence and phosphorescence 2b.3 Fluorescence quenching: concentration quenching 2b.4 Quenching by excimer and exciplex emission, 2b.5 Fluorescence resonance energy transfer between photo-excited donor and acceptor systems. 2b.6 Stern-Volmer relation 2b.7 Critical energy transfer distances 2b.8 Energy transfer efficiency 2b.9 Examples and analytical significance 2b.10 Bimolecular collisional quenching and Stern-Volmer equation.	
UNIT III	Macromolecules	15 L
	3.1 Macromolecules: Mechanism of polymerization 3.2 Molecular weight of a polymer (Number and mass average) 3.3 viscosity average molecular weights 3.4 Degree of polymerization and molecular weight 3.5 Practical significance of polymer molecular weight 3.6 Methods of determining molecular weights (Osmometry, viscometer, light scattering ,diffusion and ultracentrifugation) 3.7 Chemistry of polymerization: Ceiling temperature, Free radical polymerization (Initiation, propagation and termination) 3.8 Kinetics of free radical polymerization, step growth polymerization (Poly condensation) 3.9 Molecular weight distribution, 3.10 Kinetics of step polymerization and cationic and anionic polymerization 3.11 Electronically conducting polymers 3.12 Thermodynamics of polymer solutions: Flory-Huggins Theory. 3.13 Glass transition temperature and molecular weight, factors influencing Glass transition temperature, determination of glass transition temperature 3.14 Numerical problems	
UNIT IV	Molecular Spectroscopy	15 L
	4.1 Recapitulation: Width and intensity of spectral transitions 4.2 Fourier transform 4.3 Signal-to-noise ratio 4.4 Microwave spectroscopy 4.5 Rotation spectra of diatomic molecules-rigid and non-rigid molecules 4.6 Stark effect. 4.7 Infra-red spectroscopy: Harmonic and anharmonic oscillator 4.8 Types of vibrational spectra of diatomic molecules, application 4.9 Electronic spectroscopy of molecules: Born – Oppenheimer	

	approximation 4.10 Electronic spectra of diatomic molecules and it's applications..	
--	--	--

Course outcomes: After completion of the course students will be able to...

- 1) Differentiate between classical thermodynamics and Modern thermodynamics.
- 2) Know electronic structure of molecules, molecular orbital, electronically excited singlet states, designation based on multiplicity rule.
- 3) Explain prompt fluorescence, delayed fluorescence, and phosphorescence, fluorescence quenching: concentration quenching, quenching by excimer and exciplex emission.
- 4) Apply the microwave spectroscopy, rotation spectra of diatomic molecules.

Discipline Specific Elective (DSE) (Elective)**MCT-414 E-I: Analytical Chemistry I**

Course objectives: Students should be able to...

- 1) Know what is error and different types of errors.
- 2) Familiar with different types of chromatographic techniques.
- 3) Understand fluorescence and phosphorescence with respect to analytical applications.
- 4) Estimate what is Thermal Analysis, TGA, DTA and DSC.

Credits 4	MCT-414 E-I: Analytical Chemistry I	No. of hours perunit / Credit
UNIT I	Errors and Treatment in Analytical Chemistry	15 L
	1.1 Errors, Determinant, constant and indeterminate. 1.2 Accuracy and precision, Distribution of random errors. 1.3 Average deviation and standard deviation, variance and confidence limit. 1.4 Significance figures and computation rules. 1.5 Least square method. 1.6 Methods of sampling: samples size. 1.7 Techniques of sampling of gases, fluid, solids, and particulates.	
UNIT II	Chromatographic Methods	15 L
	2.1 General principle, classification of chromatographic methods. 2.2 Nature of partition forces. 2.3 Chromatographic behavior of solutes. 2.4 Column efficiency and resolution. 2.5 Gas Chromatography: detector, optimization of experimental conditions. 2.6 Ion exchanges chromatography. 2.7 Thin layer chromatography: coating of materials, preparative TLC. 2.8 Nature of column materials. 2.9 Preparation of the column.	
UNIT III	Luminescence Spectrometry	15 L
	3.1 Introduction of Luminescence Spectrometry 3.2 Comparison of absorption and fluorescence methods 3.3 Theory of Luminescence Spectrometry, fluorimetry. 3.4 Instrumentation, applications of fluorimetry 3.5 Applications of Phosphometry 3.6 Comparison of Fluorimetry and Phosphometry.	
UNIT IV	Thermal Analysis	15 L
	4.1 Introduction to thermal analysis, types of thermal analysis, significance of thermal analysis in Analytical Chemistry, effect of heat on materials, chemical decomposition, phase	

	<p>transformation etc.</p> <p>4.2 General thermal analysis applications, advantages and disadvantages.</p> <p>A) Thermogravimetry Analysis(TGA), 4.a.1. Principle, instrumentation, working, types of TGA, factors influencing TGA, curve to show nature of decomposition reactions, the product and qualities of compounds expelled, TGA in controlled atmosphere, TGA curves, analysis, research and analytical implications of TGA.</p> <p>B) Differential Thermal Analysis (DTA), 4.b.1. Instrumentation, methodology, application and research implications. Thermometric titrations method and applications Problems: Simple problems based on TGA, DTA and DSC.</p> <p>C) Differential Scanning Calorimetry (DSC) 4.c.1 Instrumentation, methodology, application and research implications. Thermometric titrations method and applications Problems: Simple problems based on TGA, DTA and DSC.</p>	
--	--	--

Course outcomes: After completion of the course students will be able to...

- 1) Explain the Errors, Average derivation and standard derivation.
- 2) Perform chromatographic methods, like Gas, Ion exchanges etc.
- 3) Apply the knowledge of fluorescence methods and its applications.
- 4) Classify and compare thermo gravimetry analysis and differential thermal analysis.

MCT-414 E-II: Applied Chemistry I

Course objectives: Students should be able to...

- 1) Study about preparation of Thin Film Materials.
- 2) Acquire the knowledge of Light-Emitting Polymers.
- 3) Learn the techniques of Biophysical Chemistry.
- 4) Understand Spread sheets and Calculations Used in Analytical Chemistry.

Credits 4	MCT-414 E-II: Applied Chemistry I	No. of hours perunit / Credit
UNIT I	Thin Film Materials	15 L
	1.1. Introduction, Definition of thin films, 1.2. Preparation of Thin Film Materials, 1.3. Methods: Spray Pyrolysis, Physical Vapor Deposition (PVD), Sputtering, DC Glow discharge and Low-pressure sputtering 1.4. Chemical Vapor Deposition (CVD) and Chemical Bath Deposition (CBD) 1.5. Methods of preparing device grade films 1.6. Thickness measurement techniques- electrical, and mechanical methods 1.7. Optical measurements and Band gap	
UNIT II	Organic Light Emitting Material-I	15 L
	2.1. Introduction, Poly (p-Phenylene Vinylenes), 2.2. Synthetic Routes to Poly (p-Phenylene Vinylenes), 2.3. Substituted Poly (p-Phenylene Vinylene) Homopolymers, 2.4. Alkoxy-Substituted Poly (p-Phenylene Vinylenes), 2.5. Alkyl-Substituted Poly (p-Phenylene Vinylenes) and their applications.	
UNIT III	Biophysical Chemistry	15 L
	3.1. Introduction to biophysical chemistry: amino acids, peptides, proteins, enzymes, nucleic acids. 3.2. Introduction to primary, secondary, tertiary and quaternary structures, acid-base properties. 3.3. Intermolecular forces: H-bonding, Vander Waals forces, Lenard -Jones potential, 3.4. Columbic interactions, 1-4 interactions, hydrophobic hydration and interaction. 3.5. Protein folding/Defolding phenomena, 3.6. Use of spectroscopic acid, 3.7. Thermodynamic tools for protein-ligand binding equilibrium, 3.8. Thermodynamic methods for determination of molar mass of biological macromolecules.	
UNIT IV	Spreadsheets and Calculations Used in Analytical Chemistry	15 L
	4.1. Keeping Records and Making Calculations,	

	4.2. More Complex Examples, 4.3. Some Important Units of Measurement, 4.4. Unified Atomic Mass Units and the Mole, 4.5. The Factor - Label Approach to Example solutions and Their Concentrations, 4.6. Chemical Stoichiometry.	
--	---	--

Course outcomes: After completion of the course students will be able to...

- 1) Explain definition, methods and application of Thin film Materials.
- 2) Derive the synthesis of Light Emitting Polymers.
- 3) Apply concept of Biophysical techniques and applications.
- 4) Draw of Spreadsheets, Units of Measurement and Calculations used in Analytical Chemistry.

MCT 415: Research Methodology (RM)

Course objectives: Students should be able to...

- 1) Understand the idea about need of Research Design.
- 2) Acquire the knowledge for implementation of Sample Survey.
- 3) Learn to prepare and process the data.
- 4) Study about Sampling and Non-Sampling Error.

Credits 4	MCT 415: Research Methodology (RM)	No. of hours perunit / Credit
UNIT I	Research Design	15 L
	1.1. Meaning of Research Design, 1.2. Need of Research Design, 1.3. Features of Good Design, 1.4. Important Concept Relating to Research Design, 1.5. Different Research Design, 1.6. Basic principles of Experimental Designs, 1.7. Important Experimental Designs.	
UNIT II	Design of Sample Surveys	15 L
	2.1. Introduction, Sample Design, 2.2. Sampling and Non-Sampling Errors, 2.3. Sample Survey and Census Survey, 2.4. Types of Sampling Designs, 2.5. Non-probability Sampling and Probability Sampling 2.6. Complex Random sampling designs.	
UNIT III	Data Preparation and process	15 L
	3.1. Data Preparation Process. 3.2. Questionnaire Checking 3.3. Editing, Coding, Classification, 3.4. Tabulation, Graphical Representation, 3.5. Data Cleaning, 3.6. Data Adjusting, 3.7. Some Problems in Analysis 3.8. Measure of Central Tendency, 3.9. Measure of Dispersion, 3.10. Measure of Skewness, 3.11. Kurtosis	
UNIT IV	Research Report and Ethics	15 L
	4.1. Research report and its structure, 4.2. Components of journal article. 4.3. Explanation of various components. 4.4. Structure of components and its importance. 4.5. Components of thesis and dissertations.	

	4.6. Referencing styles and bibliography. 4.7. Plagiarism Definition, different forms, 4.8. Consequences, unintentional plagiarism, 4.9. Copyright infringement, collaborative work.	
--	---	--

Course outcomes: After completion of the course students will be able to...

- 1) Classify the research data.
- 2) Explain different types of research.
- 3) Differentiate the complex random sampling.
- 4) Collect data about their research.

MCP-416: Chemistry Practical-I (Lab-I)
(Based on MCT 411, 412, 413)

Course objectives: Students should be able to...

- 1) Learn about ore and its complete analysis.
- 2) Understand about single stage preparation of important organic products
- 3) Acquire the knowledge about rate of reactions and kinetics of reactions
- 4) Study the estimation of Ca, Na, chloride, bromide ions.

Credits 2	MCP-416: Chemistry Practical-I (LAB-I)	No. of hours perunit / Credit 60
	<ol style="list-style-type: none"> 1) Determination of iron from hematite ore. 2) Preparation of Ammonium trioxalatochromate (III) 3) Preparation of Hexathiourealead (II) nitrate 4) Percentage purity of chromium from Ammonium trioxalatochromate(III) 5) Percentage purity of Lead form Hexathiourealead (II) nitrate 6) Determination of calcium from given drug sample. 7) Determination of hardness, alkalinity and salinity of water sample 8) One stage preparation of 5, 5 - Diphenyl hydantoine. 9) One stage preparation of 7-Hydroxy 4-methyl coumarin. 10) Beginlli reaction: Microwave assisted synthesis of Dihydropyrimidone. 11) Aromatic Electrophilic substitutions: Synthesis of p-Nitroaniline and p-Bromoaniline. 12) Estimation of Amino acids. 13) To verify the Beer-Lamberts Law and determine the concentration of given dye solution colorimetrically. 14) To determine the acid value of given oil. 15) Determination of mixture of acids and relative strength of weak acids. 16) Determination of ΔG, ΔH, and ΔS of $BaSO_4$ by conductometry. 17) Determination of molecular radius of molecule of organic compound. 18) Kinetics of reaction between bromate and iodide. 19) To determine the molar extinction coefficient and unknown concentration of given sample colorimetrically. 20) To Study the kinetics of iodination of acetone spectrophotometrically 	

Course outcomes: After completion of the course students will be able to...

- 1) Explore different ore analysis having different metal compositions.
- 2) Perform the estimations and preparations of organic compounds.
- 3) Explain variety of instrumentation techniques.
- 4) Apply the knowledge of different practical's from Inorganic, Organic and Physical

Chemistry

M. Sc. Part – I, Semester II
Discipline Specific Course (DSC) (Mandatory)
MCT-421: Inorganic Chemistry II

Course objectives: Students should be able to...

- 1) Acquire the knowledge of chemistry of non-transition elements.
- 2) Understand stereochemistry and bonding in main group compounds.
- 3) Learn the chemistry of f-block elements.
- 4) Study the Group Theory and Molecular Symmetry.

Credits 4	MCT-421: Inorganic Chemistry II	No. of hours perunit / Credit
UNIT I	Chemistry of Non-transition Elements and their compounds	15 L
	1.1. General discussion on the properties of the non-transition elements 1.2. Polymorphism in carbon, phosphorous and Sulphur 1.3. Synthesis, properties and structure of boranes 1.4. Carboranes 1.5. Silicates 1.6. Sulphur-nitrogen compounds 1.7. Structure and bonding in oxyacid of nitrogen, Sulphur, phosphorous, and halogens 1.8. Interhalogens 1.9. Pseudohalides	
UNIT II	A) Stereochemistry and bonding in Main group compounds	08 L
	2.A.1. Hybridization and structure of molecules 2.A.2. VSEPR Theory 2.A.3. $p\pi-p\pi$ and $p\pi-d\pi$ bonds 2.A.4. Bent rule 2.A.5. Walsh Diagram 2.A.6. Back bonding 2.A.7. Some simple reactions of covalently bonded molecules (atomic inversion, Berry Pseudorotation, Nucleophilic displacement, free radical reaction)	
	B) Bioinorganic Chemistry	07
	2.B.1. Mineral origin of life 2.B.2. Transition metal ions in biology 2.B.1. Structure and properties of metalloproteins 2.B.2. Porphyrines 2.B.3. Cytochromes 2.B.4. Ferredoxins and iron Sulphur proteins 2.B.5. Ion transport across membranes 2.B.6. Nitrogen fixation nitrogenase.	

UNIT III	Chemistry of f-block elements (Lanthanides and Actinides)	15 L
	3.1. Occurrence, properties of the f-block elements 3.2. Colour, oxidation state, Spectral and magnetic properties of lanthanides and actinides 3.3. Lanthanide contraction 3.4. Use of lanthanide compounds as shift reagents 3.5. Compounds of lanthanides 3.6. Photoluminescence properties of lanthanide compounds 3.7. Modern methods of separation of lanthanides and actinides, 3.8. Applications of lanthanide and actinide compounds in Industries	
UNIT IV	Group Theory and Molecular Symmetry	15 L
	4.1. Symmetry operations 4.2. Symmetry elements 4.3. Point group and its classification (C _n -type, D _n -type, Special-type) 4.4. Schoenflies symbol for point groups 4.5. Determination of point group for AB ₂ (Bent), AB ₃ (Trigonal pyramid), AB ₃ (Trigonal Planar), AB ₄ (Square planar), AB ₅ (Trigonal bipyramidal), AB ₆ (Octahedral), CO ₂ , HCl, CO. 4.6. Symmetry and dipole moment of molecule 4.7. Symmetry and optical active Group and its Properties 4.8. Group multiplication table 4.9. Reducible and Irreducible representations 4.10. Great orthogonally theorem (without proof) and its importance 4.11. Construction of character table for C _{2v} & C _{3v} point groups 4.12. Mulliken symbol ismrules for irreduciblerep resentations & its illustrations.	

Course outcomes: After completion of the course students will be able to...

- 1) Understand chemistry of non-transition elements for their coordination compounds.
- 2) Explore conceptual fact of atom and molecule.
- 3) Demonstrate the spectral and magnetic properties.
- 4) Perform the symmetry operations.

MCT-422: Organic Chemistry II

Course objectives: Students should be able to...

- 1) Get knowledge regarding various important name reactions.
- 2) Understand the important oxidizing and reducing agents.
- 3) Know of concept and synthetic applications of hydroboration, enamines and ylides.
- 4) Learn importance of organometallic compounds.

Credits 4	MCT-422: Organic Chemistry II	No. of hours perunit / Credit
UNIT I	Study of Organic reactions: Mechanism of condensation reaction involving enolates 1.a.1. Benzoin 1.a.2. Stobbe 1.a.3. Demjanov reaction 1.a.4. Robinson annulation 1.a.5. Chichibabin 1.a.6. Simon-Smith 1.a.7. Uhlmann 1.a.8. Mc-Murry 1.a.9. Dakin, 1.a.10. Curtius 1.a.11. Lossen 1.a.12. Suzuki coupling reactionn.	15 L
UNIT II	Oxidation and Reduction : a) Oxidation 2.a.1. CrO ₃ , 2.a.2. PDC, 2.a.3. PCC, 2.a.4. KMnO ₄ , 2.a.5. MnO ₂ , 2.a.6. Swern, 2.a.7 H ₂ O ₂ 2.a.8. Pb(OAc) ₄ , NaIO ₄ and HIO ₄ , 2.a.9. Pd-C, 2.a.10. m-CPBA, 2.a.11. O ₃ 2.a.12. Etard oxidation,	15 L 08 L
	b) Reduction 2.b.1. General mechanism and selectivity, 2.b.2. important applications of the following reducing reagents: 2.b.3. Metal hydride reduction: Boron reagents (NaBH ₄ , NaCNBH ₃ , Na(OAc) ₃ BH), 2.b.4 Aluminium reagents (LiAlH ₄ , DIBAL-H, RedAl),	07 L

	2.b.5 Reduction with H ₂ /Pd-C, 2.b.6 Wilkinson's catalyst 2.b.7 Wolff Kishner reduction.	
UNIT III	Hydroboration, Enamines and Ylides a) Hydroboration: 3.a.1. Various hydroborating agents their Mechanism 3.a.2 Synthetic Applications i) 9- BBN, ii)Thexyl borane, iii)Diisamyl borane	15 L 05 L
	b) Enamins: 3.b.1 Formation of enamines. 3.b.2 Reactivity of enamines.	05 L
	c) Ylides: 3.c.1. Phosphorus ylide. 3.c.2. Nitrogen ylide. 3.c.3. Sulphur ylide.	05 L
UNIT IV	Study of Organometallic compounds: 4.1 Organo-lithium 4.2 Organo-cobalt 4.3 Organo -Fe 4.4 Organo -Ce, 4.5 Organo -Ti, 4.6 Organo- Cd. 4.7 Use of lithium dialkyl cuprate, their addition to carbonyl and unsaturated carbonyl compounds.	15 L

Course outcomes: After completion of the course students will be able to...

- 1) Explain organic reaction mechanism involved in various reactions.
- 2) Describe mechanism of oxidizing and reducing reagents.
- 3) Understand mechanism and synthetic applications of hydroboration, enamines and ylides.
- 4) Recognize applications of organometallic compounds in organic synthesis.

MCT-423: Physical Chemistry II

Course objectives: Students should be able to...

- 1) Understand the various operators and Schrodinger equation.
- 2) Learn the theoretical Statistical Thermodynamics.
- 3) Learn the theoretical Huckel theory of inter-ionic attraction.
- 4) Acquire the Homogeneous and Heterogeneous catalysis.

Credits 4	MCT-423: Physical Chemistry II	No. of hours perunit / Credit
UNIT I	Quantum Chemistry	15 L
	1.1. Introduction: Wave particle duality of matter 1.2. De Broglie's hypothesis, Uncertainty principle, Schrodinger equation 1.3. conditions for acceptable wave functions and its interpretation 1.4. Operators: algebra of operators, linear operator, commutator, angular momentum operator, ladder operator and operator related theory 1.5. Normalization and orthogonality 1.6. Eigen functions and Eigen values 1.7. postulate of quantum mechanics 1.8. Solutions of wave equation for a free particle and particle in a box problem 1.9. Transition dipole moment integral and selection rule 1.10. symmetric and antisymmetric wave functions 1.11. Pauli Exclusion Principle 1.12. spectroscopic term symbols.	
UNIT II	Statistical Thermodynamics	15 L
	2.1 Stirling Approximation 2.2 Weights and configurations 2.3 The most probable configuration 2.4 Ensembles, ensemble average and time average of property. 2.6 Maxwell-Boltzmann (MB) distribution law 2.7 Partition function and its significance. 2.8 Rotational, translational, vibrational and electronic partition functions 2.9 Relationship between partition function and thermodynamic properties 2.10 Thermodynamic probability and entropy: Boltzmann -Planck equation 2.11 Application to mono atomic gases-Sackur-Tetrode equation and applications to di atomic molecules 2.12 Limitations of Maxwell-Boltzmann statistics 2.13 Numerical Problems.	

UNIT III	Electrochemistry	15 L
	3.1 Debye - Huckel theory of inter-ionic attraction 3.2 ionic atmosphere 3.3 time of relaxation 3.4 relaxation and electro-phoretic effects, 3.5 Debye-Huckel-Onsagar equation and its validity for dilute solutions and at appreciably concentrated solutions 3.6 Abnormal ionic conductance of hydroxyl and hydrogen ions 3.7 Activity coefficients: forms of activity coefficients and their interrelationship 3.8 Debye-Huckel limiting law for osmotic and activity coefficients of dilute electrolytic solutions and its applications to concentrated solutions 3.9 Debye-Huckel-Bronsted equations 3.10 Quantitative and qualitative verification of Debye-Huckel limiting law 3.11 Bjerrum theory of ion-ion association 3.12 Types of electrode 3.13 Determination of activity coefficients of an electrolyte using concentration cells 3.14 degree of dissociation of mono basic weak acid (approximate and accurate), instability constant of silver ammonia complex 3.15 Acid and alkaline storage batteries.	
UNIT IV	Chemical Kinetics	15 L
	4.1. Experimental methods of following kinetics of a reaction, chemical and physical (measurement of pressure, volume, EMF, conductance, diffusion current and absorbance) methods and examples 4.2. Steady state approximation and study of reaction between NO ₂ and F ₂ 4.3. decomposition of ozone, and nitrogen pentoxide. 4.4. Ionic reaction: Primary and secondary salt effect, 4.5. Homogeneous catalysis: acid and base catalyzed reactions, 4.6. Michaelis-Menten enzyme catalysis 4.7. Heterogeneous catalysis: Adsorption of gas on a surface and its kinetics 4.8. Catalyzed hydrogen- deuterium exchange reaction.	

Course outcomes: After completion of the course students will be able to...

- 1) Explore applications of commutator, linear operators, uncertainty principle.
- 2) Explain Boltzmann-Plank equation, Sackur-tetrode equation, Ensembles, ensemble average and time average of property.
- 3) Demonstrate Debye-Huckel theory of inter-ionic attraction, ionic atmosphere, time of relaxation, Debye-Huckel-Onsagar equation and its validity for dilute solutions and at appreciably concentrated solutions.
- 4) Student must explain Experimental methods of following kinetics of a reaction,

chemical and physical (measurement of pressure, volume, EMF, conductance, diffusion current and absorbance) methods.

Discipline Specific Elective (DSE) (Elective)**MCT-424 E-I: Analytical Chemistry II**

Course objectives: Students should be able to...

- 1) Understand interpretation of IR, NMR and mass spectra.
- 2) Familiar with ESR, IR, NMR and Mass techniques.
- 3) Familiar with Mossbauer and ESR Spectroscopy.
- 4) Know atomic absorption and emission spectroscopy.

Credits 4	MCT-424 E-I: Analytical Chemistry II	No. of hours perunit / Credit
UNIT I	A] Nuclear Magnetic Resonance (NMR):	15 L
	1a.1 Recapitulations of NMR, 1a.2 Elementary ideas of NMR Integration 1a.3, Larmor frequency, 1a.4 Absorption of radio frequency. 1a.5 Instrumentation (FT-NMR). Sample preparation, chemical shift, 1a.6 Factor affecting chemical effect, spin-spin coupling, coupling constant, Cosy, Noky, DEPT, ¹⁹ F, ¹ H, ¹³ C, ³¹ P, and ¹⁴ NNMR. 1a.7 First order coupling, applications to simple structural problems.	
	B] Mass spectroscopy (MS):	
	1b.1 Instrumentation, working of mass spectrometer (double beam). 1b.2 Formation of different types of ions, McLafferty rearrangements 1b.3 Nitrogen rule, C-13 rule, fragmentation of alkanes, alkyl aromatics, alcohols and ketones, simple applications, 1b.4 simple structural problems based on IR, UV, NMR and MS.	
UNIT II	A] Infrared Spectroscopy (IR)	15L
	2a.1 Introduction, instrumentation of Infrared Spectroscopy 2a.2 Fundamental modes of vibrations, 2a.3 Fundamental group region, 2a.4 sampling technique, 2a.5 selection rules, 2a.6 types of bonds, 2a.7 absorption of common functional groups. 2a.8 Factors affecting frequencies, applications.	
	B] Electron Spin Resonance Spectroscopy (ESR)	
	2b.1 Introduction, 2b.2 Factors affecting on g value 2b.3 Instrumentation 2b.3 Electron nucleus interaction 2b.4 Hyperfine Interaction-Isotropic and anisotropic coupling (Splitting)	

	2b.5 ESR of d^1 and d^9 transition metal ions in cubic and tetragonal ligand fields. 2b.6 Applications of ESR	
UNIT III	Mossbauer Spectroscopy	15L
	3.1 Introduction 3.2 Principle Mossbauer Spectroscopy 3.3 Mossbauer effect 3.4 Apparatus for Mossbauer Spectroscopy 3.5 Lamb Mossbauer factor 3.6 Mossbauer nuclides 3.7 Formation of Mossbauer nuclides 3.8 Standard reference absorber 3.9 Application of studies of bonding structures of Fe^{+2} and Fe^{+3} compounds including those of intermediate, spin and Sn^{+2} and Sn^{+4} compounds	
UNIT IV	Flame Atomic Absorption and Emission Spectrometry	15 L
	A) Absorption Spectrometry 4a.1 Introduction and Principle 4a.2 Instrumentation, Single and double beam AAS, 4a.3 Preparation of samples 4a.4 Measurement of atomic absorption 4a.5 Calibrating solution and methods of Calibration 4a.6 Advantages of atomic absorption 4a.7 Disadvantage and limitation of atomic absorption.	
	B) Emission Spectrometry	
	4b.1 Introduction and Principle 4b.2 Flame and Flame Spectra 4b.3 Variation of emission intensity within the flame 4b.4 Chemical reaction and temperature in Flames 4b.5 Instrumentation of single beam and double beam flame spectrophotometer. 4b.6 Applications	

Course outcomes: After completion of the course students will be able to...

- 1) Explain Electronic transitions, UV and IR spectroscopy.
- 2) Acquire the knowledge of sampling technique, selection rules.
- 3) Classify the spectral parameters and bonding structures of Fe^{+2} and Fe^{+3} compounds.
- 4) Differentiate between AAS and FES, and ICP-AES.

MCT-424 E-II: Applied Chemistry II

Course objectives: Students should be able to...

- 1) Learn about fabrication of Metal matrix composites
- 2) Acquire the knowledge of Organic Light-Emitting Diodes.
- 3) Study the mechanism of action of peptides.
- 4) Understand knowledge of Statistical Data, variance, errors and sampling.

Credits 4	MCT-424 E-II: Applied Chemistry II	No. of hours perunit / Credit
UNIT I	Metal matrix composites	15 L
	1.1. Fabrication, interface, 1.2. Properties and applications, 1.3. Dispersion strengthened, 1.4. Particle reinforced, 1.5. Fiber and laminate reinforced composites, 1.6. Fiber reinforced super alloy composites, 1.7. Superconducting composites Introduction type and fabrication. 1.8. Ceramic matrix composites - Fabrication, interface, properties and applications, 1.9. Carbon fiber composites- Fabrication, interface, properties and applications, 1.10.Advanced C-C composites.	
UNIT II	Organic light emitting material-II	15 L
	2.1. Organic Small Molecule Materials for Organic Light-Emitting Diodes. 2.2. Introductions, 2.3. Structure, Properties and its applications of Hole Injection Materials 2.4. Fluorocarbon Polymers and Hole Transpot Material 2.5. Triarylaminines, 2.6. Triphenylmethanes, 2.7. Phenylazomethines.	

UNIT III	Application of Biophysical Chemistry	15 L
	3.1. Thermodynamics of biopolymer Solutions: Solutions of biopolymers, 3.2. Effect of ΔG , ΔH and ΔS on dissolution of polymer, 3.3. Entropy and heat of mixing of polymer solutions, 3.4. Osmotic pressure, 3.5. Membrane equilibrium. 3.6. Fluorescence spectroscopy using labelled peptides for determination of binding and stoichiometry, 3.7. Structural studies of peptides interacted with bacterial cell by NMR, to study the biophysical properties/ interactions by using UV-Visible spectroscopy.	
UNIT IV	Statistical Data	15 L
	4.1. Confidence Intervals, 4.2. Statistical Aids to Hypothesis Testing, 4.3. Analysis of Variance, 4.4. Detection of Gross Errors, 4.5. Analytical Samples and Methods, Sampling, 4.6. Automated Sample Handling, 4.7. Standardization and Calibration, 4.8. Lab-On-a-Chip, 4.9. A Comparison method for aflatoxins, 4.10. Multivariate calibration, 4.11. Figures of merit .	

Course outcomes: After completion of the course students will be able to...

- 1) Explain fabrication, properties and applications of Metal matrix composites.
- 2) Evaluate the structure, properties and application of Organic Light Emitting Materials.
- 3) Demonstrate a core knowledge base in the theory and practice of modern Biochemistry.
- 4) Understand basic theoretical and applied principles of Statistical Data in Analytical samples.

Credits 4	MCT-425: Research Project (RP)	No. of hours perunit / Credit 60
<ul style="list-style-type: none"> • Working hours are same as practical of project length should be sufficient. • Project report must be written systematically and presented in bound form: The project will consist of name page, certificate, content, summary of project (2-3 page) followed by introduction (4 to 7 pages), literature survey (4-7) pages (recently published about 30 papers must be included), experimental techniques, results, discussion, conclusions, Appendix consisting of: 1) references, 2) standard spectra / data if any and 3) safety precautions. • Typically, student has to present his practical work and discuss results and conclusions in details (20-30 min.) which will be followed by question-answer session (10 min). • It is open type of examination. 		

MCP-426: Chemistry Practical II (LAB-II)
(Based on MCT 421,422,423 courses)

Course objectives: Students should be able to...

- 1) Learn about alloy and its complete analysis.
- 2) Understand single stage Quantitative analysis of important organic products.
- 3) Acquire the knowledge about rate of reactions and kinetics of reactions.
- 4) Study the experiments of Inorganic, Organic and Physical Chemistry.

Credits 2	MCP-426: Chemistry Practical II (LAB-II)	No. of hours perunit / Credit
	<ol style="list-style-type: none"> 1) Determination of iron & chromium from steel. 2) Preparation of Hexathiourea-plumbous(II)nitrate 3) Preparation of Potassium hexathiocyanatochromate (III) tetrahydrate 4) Preparation of Pentamminechlorocobalt (III) chloride 5) Preparation of Penta-aqua-chlorochromium(II)chloride 6) Preparation of Copper ferrite 7) To determine the amount of iron in given soap sample by colorimetrically. 8) Qualitative analysis: Separation and identification of the two component mixtures using Chemical and physical methods. 9) Steam distillation techniques. 10) Estimation of pesticide 11) Analysis of pharmaceutical tablets: Ibrufen / INAH 12) Colorimetric estimation of drugs/dyes 13) Column and thin layer chromatography 14) Interpretation of IR spectra. 15) Determination of binary mixture of halides using Potentiometry. 16) Verification of Onsager Equation for 1:1 type strong electrolyte. 17) Kinetics of iodination of acetone in presence of strong acid. 18) To draw polar plots of atomic orbitals like $1s, 2p_z, 3d_{z^2}$ by using angular part of hydrogen atom wave function. 19) Determination of atomic refractions of H, C and Cl atoms. 20) To determine formula of complex ion by Job's method by colorimetry. 	

Course outcomes: After completion of the course students will be able to...

- 1) Explore different alloy analysis having different metal compositions.
- 2) Perform the estimations and preparations of organic compounds.
- 3) Explain variety of instrumentation techniques.
- 4) Apply the knowledge of different practical's from Inorganic, Organic and Physical Chemistry
